Non-negative Matrix Factorization

## Non-negative Matrix Factorization (NMF)

## Applications to audio

- ▶ Very popular tool for data analysis
- ▶ The original paper have got 7000+ citations
- ▶ One of the standard tools for data mining
- ▶ Has found place in many domains
  - ▶ Audio/Speech/Music processing
  - ▶ Computer vision
  - ▶ Recommender systems ...
- ▶ Audio source separation
- ▶ Audio restoration
- ▶ Music transcription
- ▶ ...

Audio source separation :

## Non-Negative matrix factorization

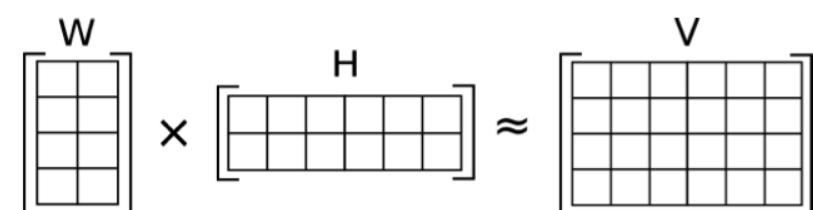

### Partie II

#### NMF

► Aim : decompose a non-negative matrix  $V$  as :

$$V \approx WH$$

►  $W$  and  $H$  are also non-negative

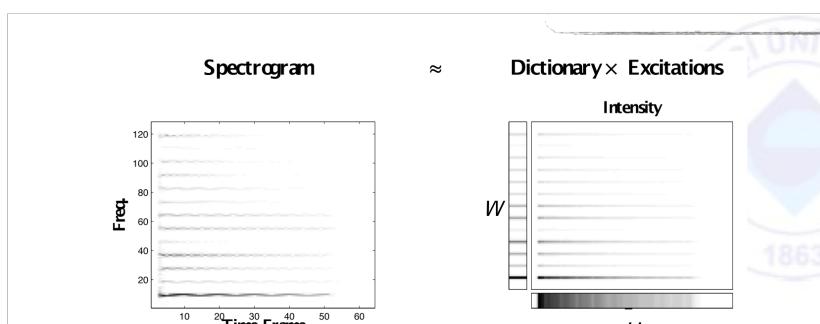

Another point of view

$$V \approx W(:,1) H(1,:;:) + W(:,2) H(2,:;:) + \dots + W(:,K) H(K,:;:)$$

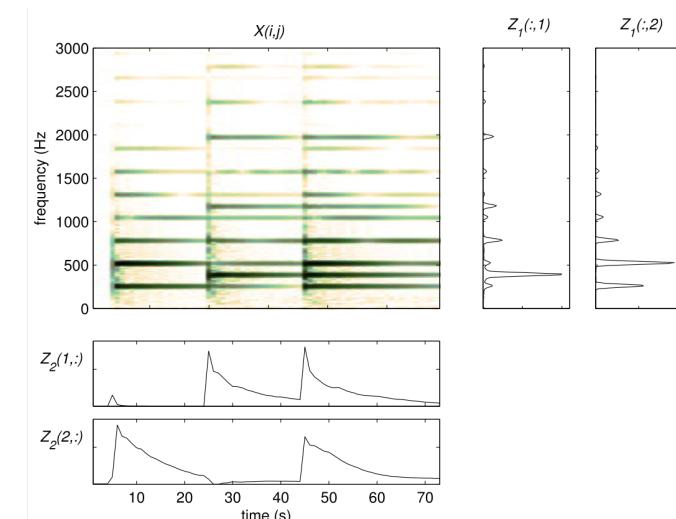

Matlab demo

## NMF on audio

A simple audio example

## NMF on audio

Mary had a little lamb

### NMF on audio

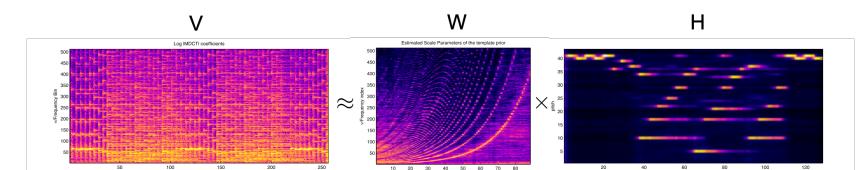

Remember :  $\boxed{\text{Matrix}} \approx \boxed{\text{Matrix}} + \boxed{\text{Matrix}} + \dots + \boxed{\text{Matrix}}$

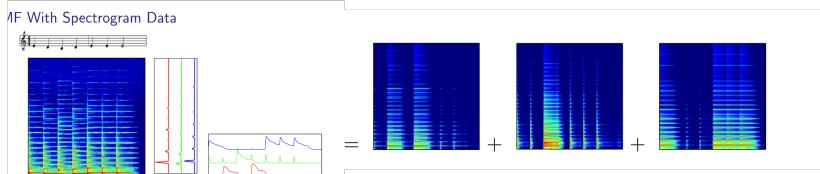

$$\boxed{\text{Matrix}} = \boxed{\text{Matrix}} + \boxed{\text{Matrix}} + \boxed{\text{Matrix}}$$

Image taken from Bryan and Sun, 2013

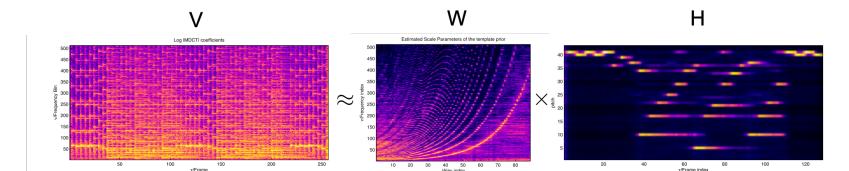

Polyphonic piano music

Source separation : by using  $W$  and  $H$  we can estimate the sources

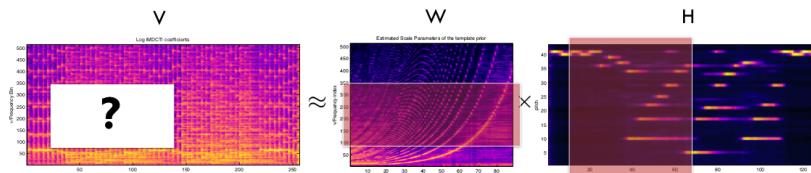

Music transcription : if the columns of  $W$  correspond to different notes,  $H$  gives us an approximate transcription

## Applications revisited

Audio restoration : use  $W$  and  $H$  to restore corrupted parts

## Partie III

How to estimate  $W$  and  $H$ ?

- We would like find  $W$  and  $H$  so that some "error" metric is minimized between  $V$  and  $WH$

$$\min_{W,H} d(V||WH)$$

- $d(V||WH)$  measured the error between  $V$  and  $WH$ 
  - Euclidean  $\rightarrow \|V - WH\|_2^2$
  - Kullback-Leibler  $\rightarrow V \log(\frac{V}{WH}) - V + WH$  (we will use KL)
  - Itakura-Saito  $\rightarrow$  also very popular in audio domain

- Easy to code two lines in MATLAB
- Iteratively apply "multiplicative" updates to the factors ( $W$  and  $H$ )

$$W \leftarrow W \circ \frac{\frac{V}{WH} H^T}{1 H^T}$$

$$H \leftarrow H \circ \frac{W^T \frac{V}{WH}}{W^T 1}$$

## Multiplicative update rules

## Multiplicative update rules

Derivation on the board

$$W \leftarrow W \circ \frac{\frac{V}{WH} H^T}{1 H^T}$$

$$H \leftarrow H \circ \frac{W^T \frac{V}{WH}}{W^T 1}$$

Matlab demo

► Recipe for audio applications

1. Compute the complex spectrogram  $X$
2. Compute the magnitude spectrogram  $V = |X|$
3. Run the multiplicative update rules on  $V$

Matlab demo

## Reconstructing the source

### Partie IV

How to reconstruct the sources by using  
 $W$  and  $H$ ?

- For source separation applications, are we done after estimating  $W$  and  $H$ ?

NO!

- Wiener filtering, lossless reconstruction  
► Reconstructing the complex spectrogram of source  $i$ :

$$X_i = X \otimes \frac{W(:, i)H(i, :)}{WH}$$

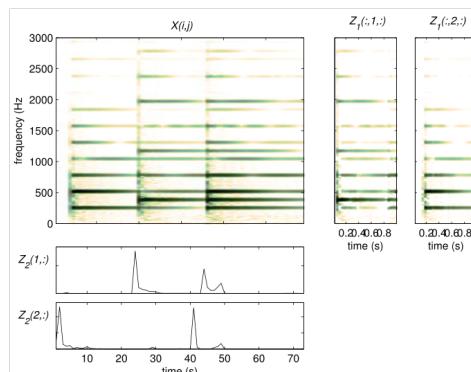

## Partie V

Matlab demo

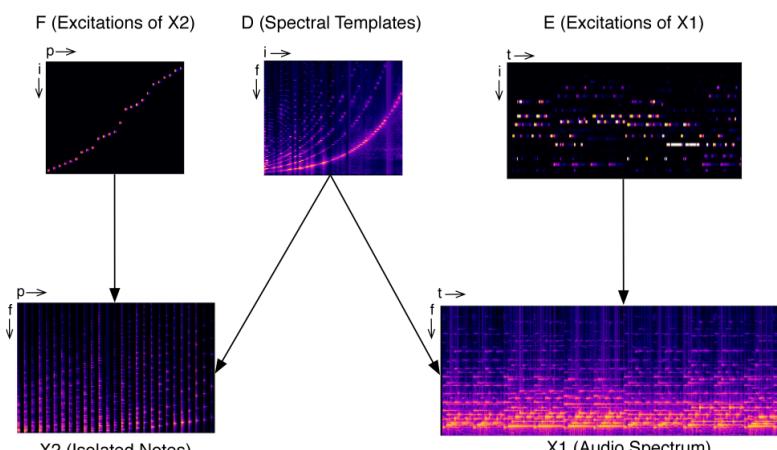

## More on NMF

## More on NMF

- ▶ Supervised vs Unsupervised
- ▶ Temporal information → Convulsive models, non-negative dynamical systems

Side information → Coupled factorization models

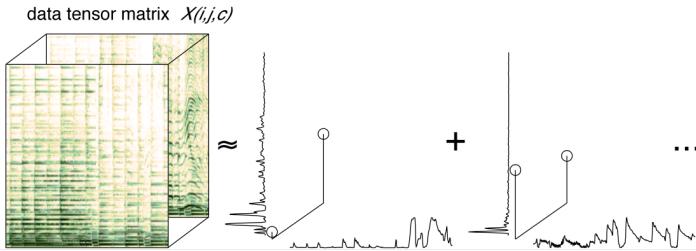

- ▶ Single channel vs Multi-channel
- ▶ Data is no more a matrix ; a tensor

- ▶ Tensor factorization models

## Partie VI

### Summary

## Summary

- ▶ Applications of NMF (source separation, restoration, transcription, etc.)
- ▶ Model definition
- ▶ MUR for estimating the factors
- ▶ Wiener filtering for reconstructing the source signals
